

General Description

The 840004-11 is a 4 output LVCMOS/LVTTL Synthesizer optimized to generate Ethernet reference clock frequencies and is a member of the family of high performance clock solutions from IDT. Using a 25MHz, 18pF parallel resonant crystal, 125MHz and 62.5MHz can be generated based on one frequency select pin (F_SEL). The 840004-11 uses IDT's 3rd generation low phase noise VCO technology and can achieve 1ps or lower typical random rms phase jitter, easily meeting Ethernet jitter requirements. The 840004-11 is packaged in a small 20-pin TSSOP package.

Features

- Four single-ended LVCMOS/LVTTL outputs
17Ω typical output impedance
- Crystal oscillator interface
- Input frequency range: 22.4MHz to 28MHz
- Output frequency range: 56MHz - 140MHz
- VCO range: 560MHz - 700MHz
- RMS phase jitter at 125MHz (1.875MHz – 20MHz):
0.70ps (typical)

Phase Noise:

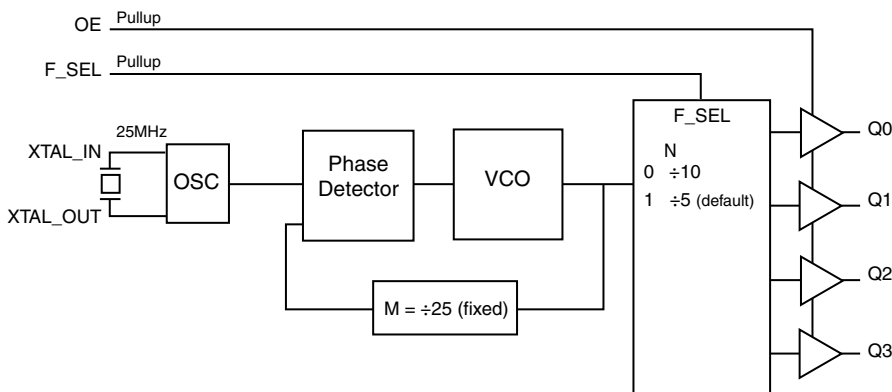

Offset	Noise Power
100Hz	-95.5 dBc/Hz
1kHz	-123.6 dBc/Hz
10kHz	-132.8 dBc/Hz
100kHz	-133.4 dBc/Hz

- Full 3.3V output supply mode
- 0°C to 70°C ambient operating temperature
- Available in lead-free (RoHS 6) package

Recommendations for Unused Input and Output Pins

Inputs:

LVC MOS Control Pins

All control pins have internal pullups; additional resistance is not required but can be added for additional protection. A 1k Ω resistor can be used.

Outputs:

LVC MOS Outputs

All unused LVC MOS outputs can be left floating. We recommend that there is no trace attached.

Power Supply Filtering Technique

As in any high speed analog circuitry, the power supply pins are vulnerable to random noise. To achieve optimum jitter performance, power supply isolation is required. The 840004-11 provides separate power supplies to isolate any high switching noise from the outputs to the internal PLL. V_{DD} , V_{DDA} and V_{DDO} should be individually connected to the power supply plane through vias, and 0.01 μ F bypass capacitors should be used for each pin. *Figure 1* illustrates this for a generic V_{DD} pin and also shows that V_{DDA} requires that an additional 10 Ω resistor along with a 10 μ F bypass capacitor be connected to the V_{DDA} pin.

Figure 1. Power Supply Filtering

Crystal Input Interface

The 840004-11 has been characterized with 18pF parallel resonant crystals. The capacitor values shown in *Figure 2* below were determined using a 25MHz, 18pF parallel resonant crystal and were chosen to minimize the ppm error.

Figure 2. Crystal Input Interface

LVC MOS to XTAL Interface

The XTAL_IN input can accept a single-ended LVC MOS signal through an AC coupling capacitor. A general interface diagram is shown in *Figure 3*. The XTAL_OUT pin can be left floating. The input edge rate can be as slow as 10ns. For LVC MOS inputs, it is recommended that the amplitude be reduced from full swing to half swing in order to prevent signal interference with the power rail and to reduce noise. This configuration requires that the output impedance of the driver (R_o) plus the series resistance (R_s) equals

the transmission line impedance. In addition, matched termination at the crystal input will attenuate the signal in half. This can be done in one of two ways. First, R_1 and R_2 in parallel should equal the transmission line impedance. For most 50Ω applications, R_1 and R_2 can be 100Ω. This can also be accomplished by removing R_1 and making R_2 50Ω. By overdriving the crystal oscillator, the device will be functional, but note, the device performance is guaranteed by using a quartz crystal.
