<sup>2</sup> Measured from differential waveform

<sup>3</sup> Slew rate is measured through the Vswing voltage range centered around differential 0V. This results in a +/-150mV window around differential 0V.

<sup>4</sup> Matching applies to rising edge rate for Clock and falling edge rate for Clock#. It is measured using a +/-75mV window centered on the average cross point where Clock rising meets Clock# falling. The median cross point is used to calculate the voltage thresholds the oscilloscope is to use for the edge rate calculations.

<sup>5</sup> Vcross is defined as voltage where Clock = Clock# measured on a component test board and only applies to the differential rising edge (i.e. Clock rising and Clock# falling).

<sup>6</sup> The total variation of all Vcross measurements in any particular system. Note that this is a subset of Vcross\_min/max (Vcross absolute) allowed. The intent is to limit Vcross induced modulation by setting  $\Delta V_{cross}$  to be smaller than Vcross absolute.

- <sup>3</sup> All Bypass Mode Input-to-Output specs refer to the timing between an input edge and the specific output edge created by it.
- <sup>4</sup> This parameter is deterministic for a given device
- <sup>5</sup> Measured with scope averaging on to find mean value.
- <sup>6</sup>  $t$  is the period of the input clock
- <sup>7</sup> Measured as maximum pass band gain. At frequencies within the loop BW, highest point of magnification is called PLL jitter peaking.

- <sup>9</sup> Measured at 3 db down or half power point.
- <sup>10</sup> Duty cycle distortion is the difference in duty cycle between the output and the input clock when the device is operated in bypass mode.

Bit 7	48	PLL Mode 1	PLL Operating Mode Rd back 1	R	See PLL Operating Mode Readback Table		Latch
Bit 6	48	PLL Mode 0	PLL Operating Mode Rd back 0	R			Latch
Bit 5			Reserved				0
Bit 4			Reserved				0
Bit 3		PLL SW EN	Enable S/W control of PLL BW	RW	HW Latch	SMBus Control	0
Bit 2		PLL Mode 1	PLL Operating Mode 1	RW	See PLL Operating Mode Readback Table		1
Bit 1		PLL Mode 0	PLL Operating Mode 0	RW			1
Bit 0	47	100M 133M#	Frequency Select Readback	R	133MHz	100MHz	Latch

**Note:** Setting bit 3 to '1' allows the user to override the Latch value from pin 5 via use of bits 2 and 1. Use the values from the PLL Operating Mode Readback Table. Note that Bits 7 and 6 will keep the value originally latched on pin 5. A warm reset of the system will have to be accomplished if the user changes these bits.
