

Description

The XP devices are ultra-low phase noise quartz-based PLL oscillators supporting a large range of frequencies and output interface types. These devices are designed to operate at three different power supplies and are available in three package sizes with several pinout configurations, as well as three operational temperature ranges.

The XP devices can be programmed to generate an output frequency from 15MHz to 2100MHz with a resolution as low as 1Hz accuracy. The configuration capability of this family of devices allows for fast delivery times for both sample and large production orders.

Parts are for one time programming (OTP) at the factory for a fixed frequency application, or can be field programmable using I2C, based on system needs (see note 1 under Pin Descriptions).

Features

- Output types: LVDS, LVPECL, CML
 - Frequency range: 15MHz to 2100MHz
- Output type: HCSSL
 - Frequency range: 15MHz to 725MHz
- Supply voltage options: 1.8V, 2.5V, or 3.3V
- Phase jitter (12kHz to 20MHz): 120fs typical
- Package options:
 - 7.0 × 5.0 × 1.7 mm
 - 5.0 × 3.2 × 1.17 mm
 - 3.2 × 2.5 × 1.07 mm
- Operating temperatures and frequency stability:
 - -40°C to +85°C, ±25ppm
 - -40°C to +105°C, ±50ppm

Pin Assignments

Figure 1. 7.0 × 5.0 mm, 5.0 × 3.2 mm, and 3.2 × 2.5 mm Packages

Table 1. Pin Descriptions

Pin #	Pin Name	Description
1	OE	Output Enable (0 = output disabled, pulled high internally)
2	NC	No connect
3	GND	Connect to ground
4	OUT0	Output
5	OUT0b	Complementary output
6	V _{DD}	Supply voltage
7	SDA ¹	Serial data
8	SCL ¹	Serial clock

¹ Pins 7 and 8 are no connect for non-I2C applications.

Absolute Maximum Ratings

Stresses above the ratings listed below can cause permanent damage to the device. These ratings, which are standard values for IDT commercially rated parts, are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range. Thermal characteristics, in actual applications, should be assessed case by case to guarantee junction temperature does not exceed 125°C.

Table 2. Absolute Maximum Ratings

Item	Rating					
V _{DD}	-0.5V to +3.8V					
OE	-0.5V to +3.8V					
Storage Temperature	-55°C to 125°C					
Maximum Junction Temperature	125°C					
Theta J _A ¹	JD8	75.9 °C/W	JX8	89.6 °C/W	JSW8	97.4 °C/W
Theta J _B ¹		48.6 °C/W		54.3 °C/W		66.8 °C/W

¹ Thermal characteristics are based on simulation in standard condition.

ESD Compliance

Table 3. ESD Compliance

Human Body Model (HBM)	2000V
------------------------	-------

Mechanical Testing

Table 4. Mechanical Testing *

Parameter	Test Method
Mechanical Shock	Half-sine wave with 0.3ms 3000G. X, Y, Z each direction 1 time.
Mechanical Vibration	Frequency: 10 to 55MHz amplitude: 1.5mm. Frequency: 55–2000Hz peak value: 20G. Duration time: 4H for each X,Y,Z axis; total 12hours.
High Temp Operating Life (HTOL)	1000 hours at 125°C (under power).
Hermetic Seal	Gross leak (air leak test). Fine leak (Helium leak test) He-pressure: 6kgf/cm ² 2 hours.

* MSL level does not apply.

AC Electrical Characteristics

Notes for all AC Electrical Characteristics tables:

1. A pull-up resistor from V_{DD} to OE enables output when pin 1 is left open.
2. Installation should include a $0.01\mu F$ bypass capacitor placed between V_{DD} and GND to minimize power supply line noise.

Table 14. 3.3V AC Electrical Characteristics

Output Waveforms

Figure 2. LVDS Output Waveforms

Figure 3. LVPECL Output Waveforms

Figure 4. HCSL Output Waveforms

Figure 5. CML Output Waveforms

Termination for 3.3V LVPECL Outputs

The clock layout topology shown below is a typical termination for LVPECL outputs. The two different layouts mentioned are recommended only as guidelines.

The differential output is a low impedance follower output that generate ECL/LVPECL compatible outputs. Therefore, terminating resistors (DC current path to ground) or current sources must be used for functionality. These outputs are designed to drive 50Ω transmission lines. Matched impedance techniques should be used to maximize operating frequency and minimize signal distortion. [Figure 6](#) and [Figure 7](#) show two different layouts which are recommended only as guidelines. Other suitable clock layouts may exist and it would be recommended that the board designers simulate to guarantee compatibility across all printed circuit and clock component process variations.

Figure 6. 3.3V LVPECL Output Termination

Figure 7. 3.3V LVPECL Output Termination

Termination for 2.5V LVPECL Outputs

Figure 8 and Figure 9 show examples of termination for 2.5V LVPECL driver. These terminations are equivalent to terminating 50Ω to $V_{CC0} - 2V$. For $V_{CC0} = 2.5V$, the $V_{CC0} - 2V$ is very close to ground level. The $R3$ in Figure 9 can be eliminated and the termination is shown in Figure 10.

Figure 8. 2.5V LVPECL Driver Termination Example

Figure 9. 2.5V LVPECL Driver Termination Example

Figure 10. 2.5V LVPECL Driver Termination Example

LVDS Driver Termination

For a general LVDS interface, the recommended value for the termination impedance (Z_T) is between 90Ω and 132Ω . The actual value should be selected to match the differential impedance (Z_0) of your transmission line. A typical point-to-point LVDS design uses a 100Ω parallel resistor at the receiver and a 100Ω differential transmission-line environment. In order to avoid any transmission-line reflection issues, the components should be surface mounted and must be placed as close to the receiver as possible. IDT offers a full line of LVDS compliant devices with two types of output structures: current source and voltage source.

The standard termination schematic as shown in Figure 11 can be used with either type of output structure. Figure 12, which can also be used with both output types, is an optional termination with center tap capacitance to help filter common mode noise. The capacitor value should be approximately 50pF . If using a non-standard termination, it is recommended to contact IDT and confirm if the output structure is current source or voltage source type. In addition, since these outputs are LVDS compatible, the input receiver's amplitude and common-mode input range should be verified for compatibility with the output.

Figure 11. Standard LVDS Termination

Figure 12. Optional LVDS Termination

Recommended Termination for HCSL Outputs

Figure 13 is the recommended source termination for applications where the driver and receiver will be on a separate PCBs. This termination is the standard for PCI Express™ and HCSL output types. All traces should be 50Ω impedance single-ended or 100Ω differential. Figure 14 is the recommended termination for applications where a point-to-point connection can be used. A point-to-point connection contains both the driver and the receiver on the same PCB. With a matched termination at the receiver, transmission-line reflections will be minimized. In addition, a series resistor (R_s) at the driver offers flexibility and can help dampen unwanted reflections. The optional resistor can range from 0Ω to 33Ω. All traces should be 50Ω impedance single-ended or 100Ω differential.

Figure 13. Recommended Source Termination (where the driver and receiver will be on separate PCBs)

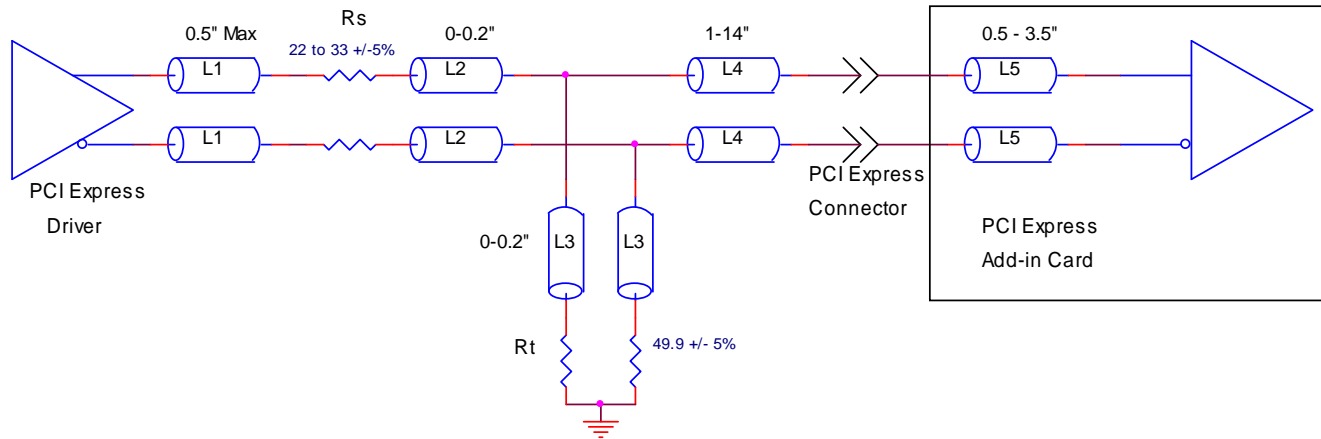

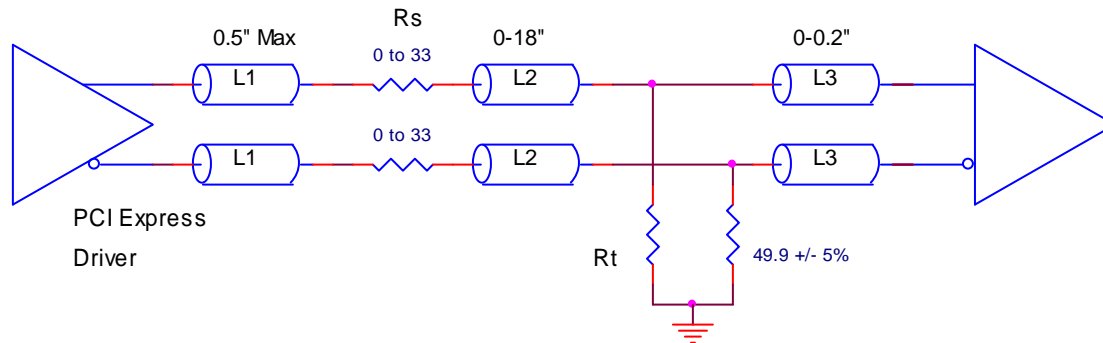

Figure 14. Recommended Termination (where a point-to-point connection can be used)

CML Termination

Figure 15 shows an example of the termination for a CML driver. In this example, the transmission line characteristic impedance is 50Ω. The R_1 and R_2 50Ω matched load terminations are pulled up to VDDO. The matched loads are located close to the receiver.

Figure 15. CML Termination Example

Package Outline Drawings

The package outline drawings are appended at the end of this document and are accessible from the link below. The package information is the most current data available.

(IDT) and its affiliated companies (herein referred to as "IDT") reserve the right to modify the products and/or specifications described herein at any time, without notice, at IDT's sole discretion. Performance specifications and operating parameters of the described products are determined in an independent state and are not guaranteed to perform the same way when installed in customer products. The information contained herein is provided without representation or warranty of any kind, whether express or implied, including, but not limited to, the suitability of IDT's products for any particular purpose, an implied warranty of merchantability, or non-infringement of the intellectual property rights of others. This document is presented only as a guide and does not convey any license under intellectual property rights of IDT or any third parties.

IDT's products are not intended for use in applications involving extreme environmental conditions or in life support systems or similar devices where the failure or malfunction of an IDT product can be reasonably expected to significantly affect the health or safety of users. Anyone using an IDT product in such a manner does so at their own risk, absent an express, written agreement by IDT.
